

Workplace Culture, Learning Integration, and Operational Constraints

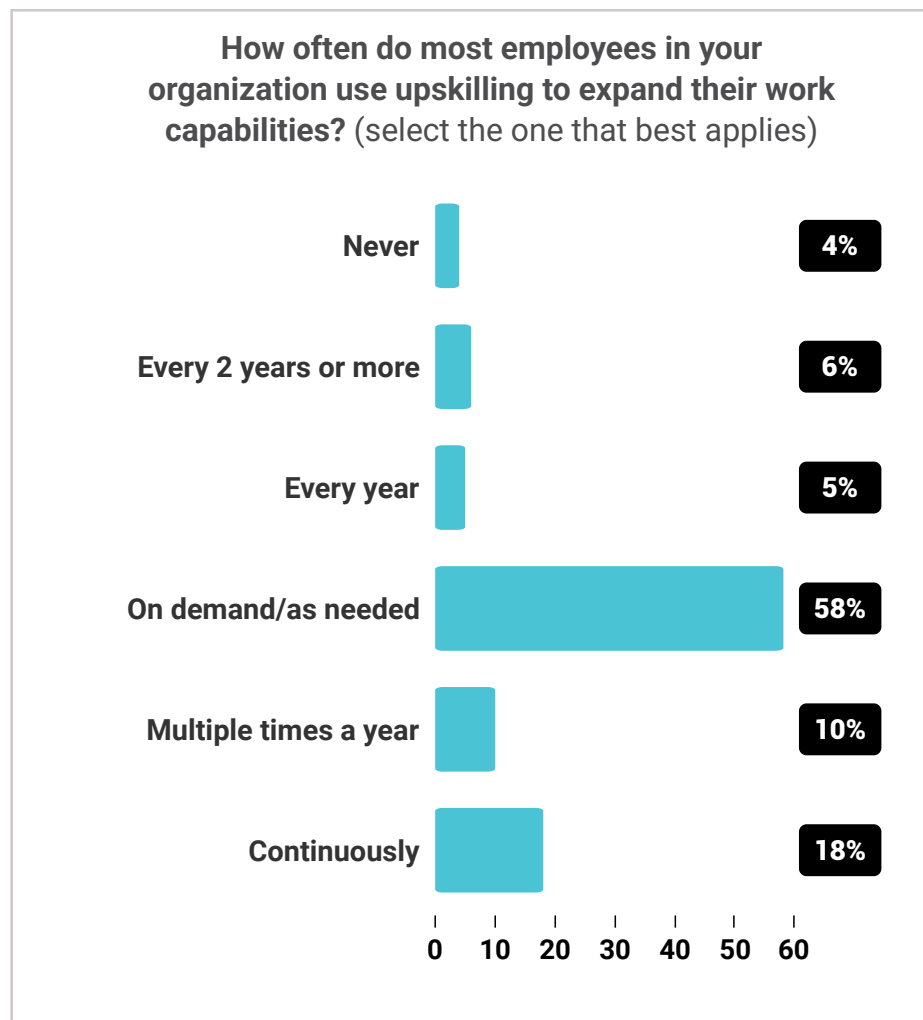

Finding: Almost three-fifths of respondents report that employees engage in upskilling on an on-demand or as-needed basis

Employee learning is driven primarily by immediate needs rather than ongoing development. Almost three-fifths (58%) report that employees engage in upskilling on an on-demand or as-needed basis, while only 18% say employees participate in continuous learning. Smaller percentages report learning taking place multiple times a year (10%) or according to a more structured schedule.

While on-demand learning can help employees address immediate skill needs, it may do little to build future capabilities or prepare for emerging workforce demands. At the same time, [growing workloads](#) and rising expectations leave employees with little time to pause, reflect, or engage in deeper learning.

Encouraging more continuous skill development could help employees build capabilities over time while improving organizational readiness for future changes in skills and work.

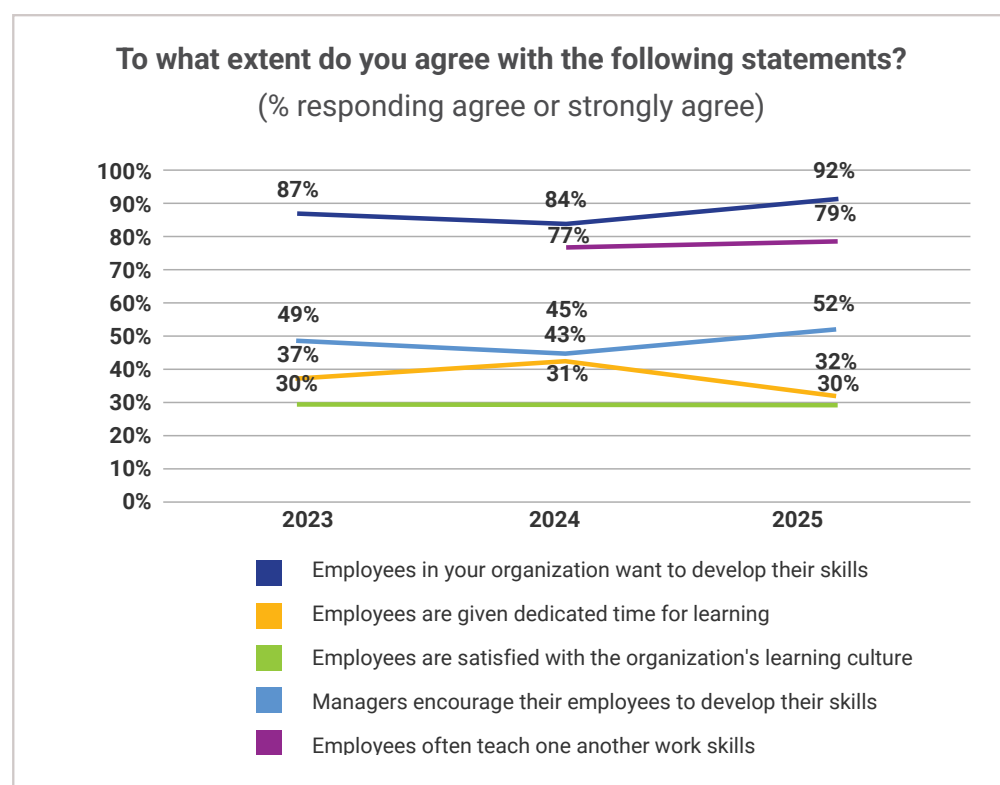

Editor's note: Respondents who answered "Don't know" were removed from the data set. They accounted for 5% of responses.

Finding: About eight in ten respondents say that employees frequently teach one another work-related skills

Peer learning remains one of the strongest aspects of workplace learning culture. Seventy-eight percent of respondents agree or strongly agree that employees frequently teach one another work-related skills, making it one of the highest-rated learning culture measures in the study. Longitudinally, agreement has stayed steady at 77% in 2024 to 79% in 2025 and 78% in 2026, suggesting that employees are increasingly relying on colleagues as an important source of knowledge sharing and skill development. [Research](#) shows that soft skills matter now more than ever and tools such as peer feedback and mentoring are essential to developing these skills.

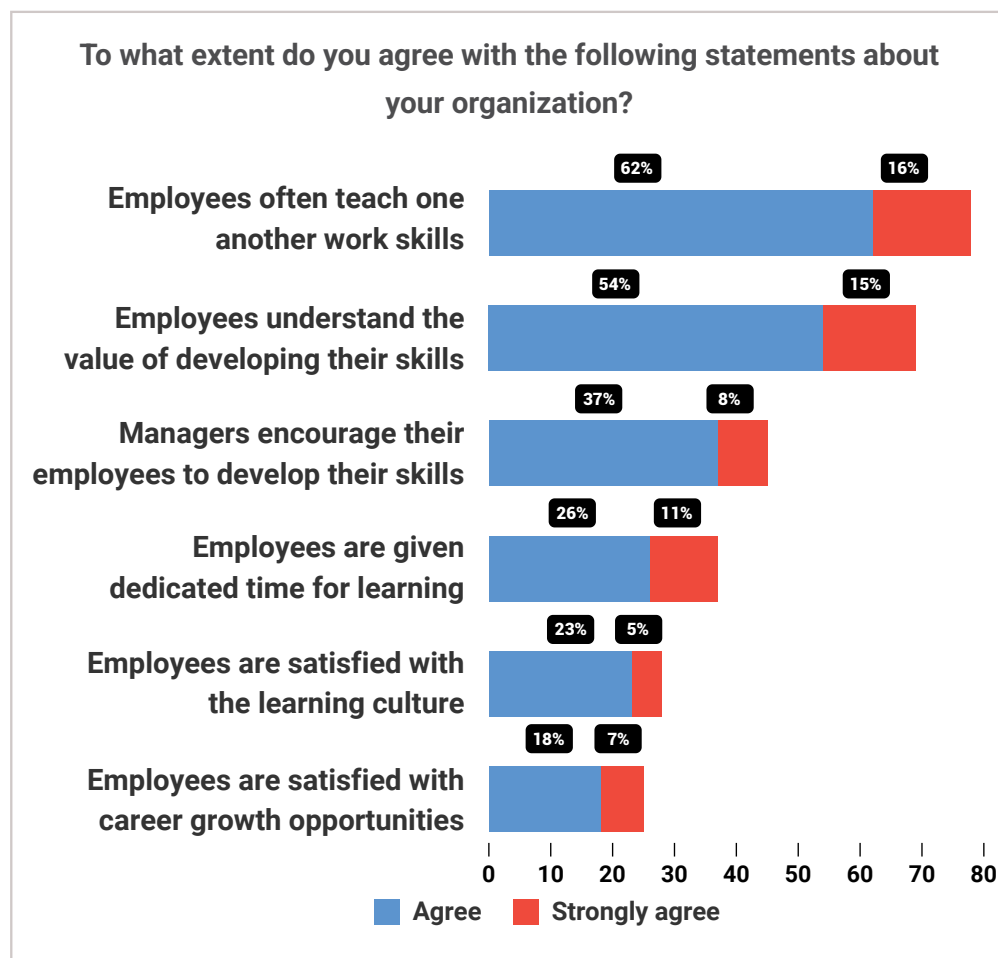

Note: The question added "about your organization in" 2025.

At the same time, organizational support for learning remains inconsistent. Only 37% of respondents agree or strongly agree that employees are provided dedicated time for learning during the workday. According to [Forbes](#), heavy daily workloads and rising performance targets leave employees with virtually zero time or energy left for training.

Managerial support is another gap with only 45% reporting positive sentiments about managerial support for employees to develop their skills. This tension may help explain why overall satisfaction with learning culture remains relatively modest. Only 28% say employees are satisfied with their organization's learning culture and 25% are satisfied with internal career opportunities.

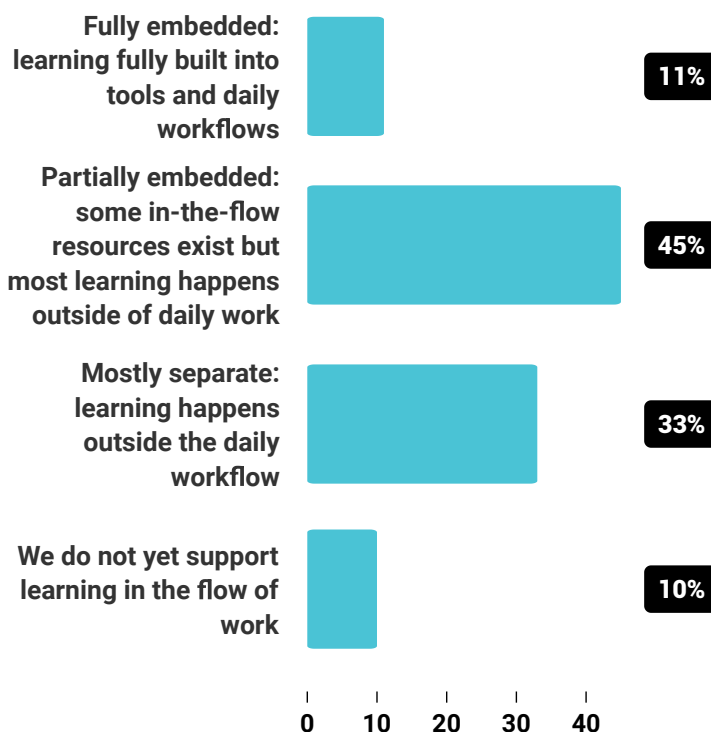

Finding: Forty-five percent of respondents report that learning is only partially integrated into employees' daily workflows

Learning in the flow of work remains more aspiration than reality for many organizations. While 45% of respondents report that learning is partially embedded into daily workflows, only 11% say learning is fully integrated into the tools and processes employees use every day. At the same time, 33% indicate that learning remains largely separate from daily work, and another 10% report that their organizations do not support learning in the flow of work at all.

These findings suggest that many organizations still rely on traditional learning approaches that require employees to step away from their work to learn. However, [research](#) suggests learning is most effective when it occurs in the flow of work, making integration into existing tools and workflows increasingly important.

To what extent is learning integrated into the flow of employees' daily work in your organization? (select the one that best applies)

Industry experts reinforce the data showing that learning must transition from isolated events into structural daily tools. Matthew Casey-Sudvary emphasizes that the future of effective learning platforms requires systems that are “*highly personalized and more performance-support*” focused.

JD Dillon critiques traditional platform boundaries, arguing that learning technology must integrate directly into the digital workspace.

“Learning tech as a concept must break free of the LMS category and shift information access / sharing into the tools used to do the job. This requires a headless approach to information architecture to reach people when and where they need support.” – JD Dillon

Becky Willis echoes this critical need for structural workflow integration and modernized architecture. According to Willis, next-generation platforms need AI at the core, not added in. She points to workflow integration, personalization, and collaborative learning as the pillars that will define next-generation platforms.

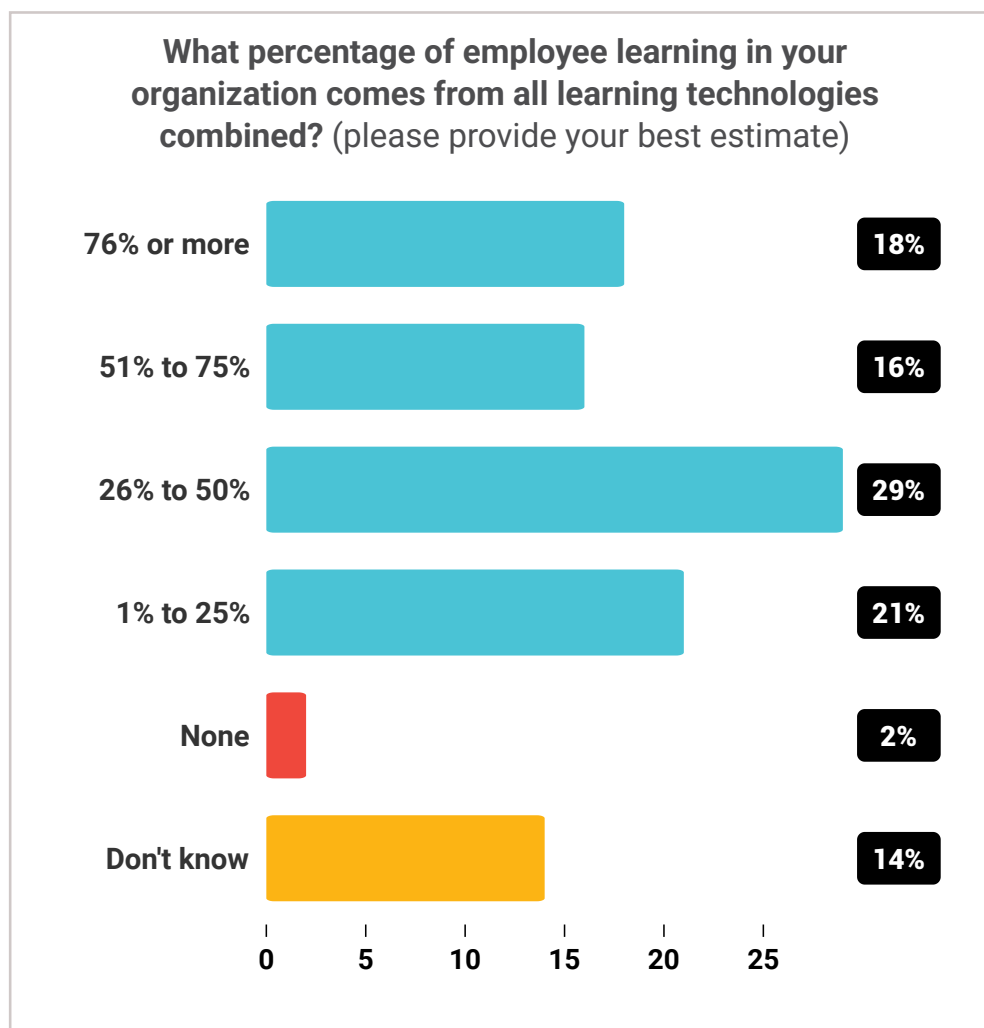

Finding: Twenty-nine percent of respondents estimate that between 26% and 50% of employee learning is delivered through technology

Organizations continue to rely on a mix of learning approaches rather than a technology-driven model. Half of respondents estimate that half or less of employee learning is delivered through technology, while only 18% report that more than three-quarters of learning occurs through digital platforms and tools.

Although learning technologies have expanded access to training, improved scalability, and increased flexibility for learners, they appear to complement rather than replace other forms of development.

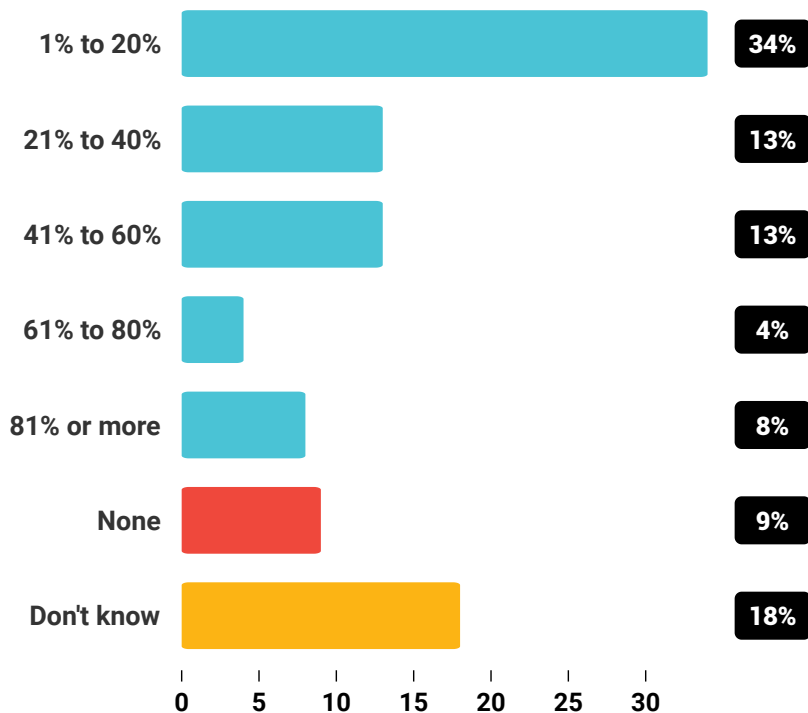

Finding: One-third of respondents expect technological trends to alter between 1% and 20% of roles within their organizations over the next two years

Organizations appear divided in their expectations regarding the impact of technological change on the workforce. While 43% anticipate little or no disruption, a substantial 25% expect more than 40% of roles to undergo significant change. This wide distribution highlights considerable uncertainty about the pace and scale of workforce transformation. The fact that 18% of respondents remain unsure about the potential impact further reinforces this uncertainty. [BCG's](#) newest operational data projects that over the next two to three years, 50% to 55% of all corporate job roles will be completely reshaped by AI.

In your organization, what percentage of jobs/roles will be substantially disrupted by market or technological trends over the next two years? (please provide your best estimate)

HRRI Strategic Recommendations

Based on our research, please consider the following suggestions:

1. Create more opportunities for continuous learning

Many employees develop skills only when an immediate need arises. Organizations can build workforce readiness by making learning a regular part of the employee experience rather than an activity reserved for specific projects or skill gaps. Consider:

- encouraging ongoing skill development throughout the year
- incorporating development goals into regular employee conversations
- providing employees with visibility into future skill requirements
- supporting self-directed learning aligned with career growth opportunities

2. Build on the strength of peer learning

Employees are already teaching and learning from one another. Organizations can amplify these behaviors by creating more structured opportunities for knowledge sharing and collaboration. Consider:

- establishing mentoring and peer coaching programs
- creating communities of practice around key skill areas
- recognizing employees who share expertise with others
- encouraging cross-functional learning and collaboration

3. Give employees time and support to learn

Learning is difficult to sustain when employees are expected to develop new skills on top of full workloads. Organizations should ensure employees have both the time and managerial support needed to learn effectively. Consider:

- dedicating time for learning during the workweek
- encouraging managers to discuss development regularly
- setting realistic expectations for learning participation
- helping managers balance operational demands with employee growth

4. Bring learning closer to the flow of work

Employees are more likely to develop new skills when learning resources are available at the moment they need them. Embedding learning into everyday work can improve both participation and knowledge application. Consider:

- integrating learning resources into commonly used tools and systems
- providing just-in-time learning opportunities
- connecting learning content to real work challenges
- making it easy for employees to access learning without leaving their workflow

5. Create clearer development pathways

Employees are more likely to invest in learning when they understand how skill development supports career growth. Organizations should help employees connect learning activities to future opportunities. Consider:

- defining skill requirements for key roles
- communicating potential career pathways
- linking learning opportunities to advancement opportunities
- helping employees identify development priorities
